PEDALS

SKATE FUZZ

Vintage Silicone Fuzz Face

This unique pedal design is based on a classic silicone Fuzz Face circuit. The artwork and layout is inspired by skateboards of the '70s with four controls (wheels) for Volume, Fuzz, Bias, and Input (input trim). Featuring top mounted input/output and center-negative DC jacks. Hand soldered, high quality axial capacitors, carbon comp resistors, premium soft-click foot switch and orange LED indicator. Operation: 9 volt, center-negative.

- **Volume** - Attenuates the overall volume of the pedal
- **Fuzz** - Attenuates the Fuzz amount
- **Input** - Adjusts the input level of your guitar affecting the gain into the circuit
- **Bias** - Adjusts the transistor bias, increasing or decreasing the “smoothness” of the fuzz tone
